With the new VizTool2.0, we can cross countries against each other where we left off in the last trail, with many dimensions side by side.

Question: Is it so, that countries that emphasize work also care much about free time (Leissure)?

Seems so. How has this been since then? We go through the waves and see what happens.

Wave	Country
4	Venezuel
4	Nigeri
4	Macedoni

El Salvador fell out of the graph, not participating that wave. The theory still seems to hold. None of the countries were in W3. One can jump back and forth between the waves.

Once you brush countries among the multiple dimensions, they pop up in the table below. When hovering over them a box of additional information from Gapminder is shown. This example is

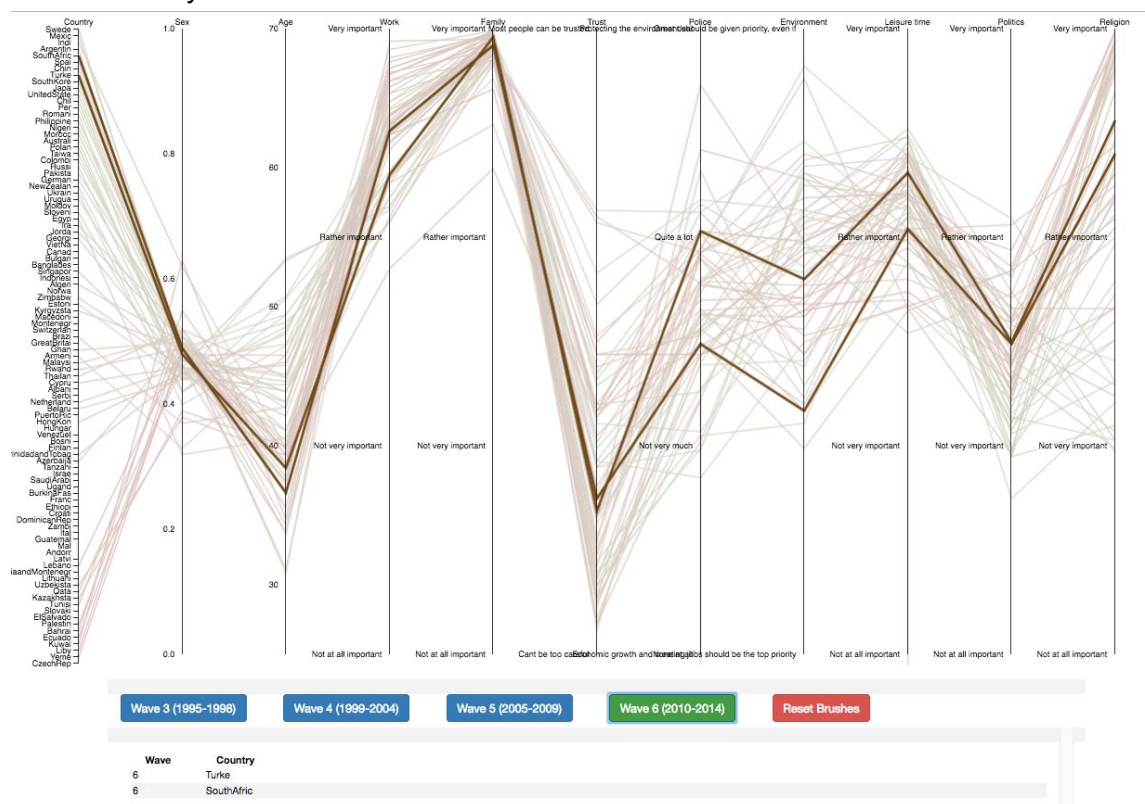

Wave	Country
3	Swede

The employment of aged 15+ this period was 57.36 % (Gapminder). These years, Swede released a mean of 5.98 tonnes of CO2 per person (Gapminder). The equality study was not done these years (Gapminder).

So: What this system can do, which was a pain using WV inhouse tools was crossing multiple variables against each other, and then watch them over time. Here, this can be done with ease: (Which countries liked to work, trusted the police, and were kind of religious?)

And now today?

Hm. Lower work interest, and South Africa has dropped somewhat in police trust. That, I would not have seen without VizTool2.0. This program is amazing.
